

Gold Fin anti-corrosion treatment

The heating exchanger of outdoor units undergoes a special treatment called Gold Fin which gives more strength to corrosion, if compare to that of conventional units, also protecting its integrity and services during the time.

15 days salty fog exposure test

PRE-HEATING FUNCTION

When the unit is set on air cooling + water heating mode, this function prevents the indoor unit from circulating too cold air in the room. The inside units fans are set on minimum speed only after the cooling tubes temperature exceeds 28C. After one minute the fan starts operating on minimum speed and later on set speed.

HEALTHY DEHUMIDIFICATION FUNCTION

Conventional units have the cold air immission in the lower part, that is an obstacle to temperature uniformity. Thanks to the immission of this unit in the higher part of the room you can obtain a uniform temperature without too much cooling.

QUIETNESS

Extra quiet operations, unique low noise design, large diameter, straight line and low noise indoor/outdoor fan and special duct design that enable the unit in quiet operation.

ENVIRONMENTAL FRIENDLY

Adopted R410a environment-friendly refrigerant that harmless to ozone (O3) layer.
